Value Based Clinical Commissioning Policies

Introduction

Across the country most, if not all, CCGs have a set of policies and procedures for limiting the number of low clinical value interventions. The Audit Commission’s report ‘Reducing expenditure on low clinical value treatments'\(^1\) analyses variation on approaches to this work. This approach was based on the 'Save to Invest' programme developed by the London Health Observatory\(^2\) incorporating the 'Croydon List' of 34 low priority treatments.

Healthcare commissioners in the North East have adopted a common set of policies since 2010. These were reviewed in and adopted by all CCGs in the North East in January 2013. This revision of the policies is based on feedback from CCGs. There are no major changes with most of the revisions being mainly clarification to aid decision making. Some policies have been removed where the commission responsibility lies with NHS England. The only additional policy is for fertility preservation in line with NICE guidance. All the changes are set out in the table at the end of the document.

Guidance for making referrals

This guide has been developed to assist clinicians answer questions in relation to individual funding requests (IFRs). At the end of this guide you will find quick links to qualifying criteria of individual policies contained within the Value Based Clinical Commissioning Treatment Policies document.

Frequently asked questions

Why do we need policies?
What do these policies cover?
Who are they for?
How has the list been compiled?
How have they been developed?
Can you give any general guidance about what is in the policies?
What happens when funding is approved?
What if funding is declined?
Who tells the patient if funding is declined?
What about treatments that have already started under private arrangements?
What about treatments that have been started and completed under private arrangements?
What if I have a patient whose needs are exceptional?
What about psychological considerations?
Are photographs helpful?
What if GPs make referrals outside the criteria outlined in these policies?
What if surgeons undertake procedures outside the indications in these policies?
Where can I find out more?

1. Why do we need policies?

NHS resources come under ever greater pressures each year. Ensuring that treatment and care is focused where it can make the biggest difference is a key part of making best use of these resources. This is a key challenge for all NHS organisations, and a prime focus for commissioning among CCGs. These policies help clinicians identify interventions with limited benefit, thereby providing potential for reinvesting elsewhere, where potential benefits are greater.

The alternative to having policies of this kind is to leave each decision to individual GPs, to manage individual dilemmas without guidance and without the context of the health needs of the wider population.

2. What do these policies cover?

These cover interventions where there is significant risk that patients undergoing them will gain little health benefit.

The procedures have low rather than no clinical value. Some may be effective, but may have low value because other (medical) treatments could be tried first. Other effective procedures may provide large benefits for some patients but less to those with few symptoms, where risks and benefits are closely balanced. There are interventions which are effective in some but give no clinical value in others. Finally, there are those interventions that whilst effective, are undertaken for primarily cosmetic reasons, which commissioners often consider as providing low clinical value.

3. Who are they for?

They are to assist GPs in making referral decisions, where the principal reason for referral is for surgical intervention. They are also to assist providers of surgical services - a statement about what the NHS will pay for.

4. How has the list been compiled?

The list of procedures is a historical one, starting with declarations about plastic surgery and IVF, and have grown with greater understanding about health benefits from surgical intervention, publication of authoritative national guidelines and unexplained variations in clinical practice.

5. How have they been developed?

Every effort has been made to get an up to date view of practice. However, some will contain contentious criteria - for example among eligibility for plastic surgery and IVF.

We aim to take account of the most up to date clinical evidence, legal precedent and gain consensus before publication. A full review of these policies is currently underway, led by Public Health staff across the North East and keeping these up to date will require significant ongoing efforts.

6. Can you give any general guidance about what is in the policies?
Here is some general advice about those policies which are most commonly referred to.

For procedures that are often carried out for cosmetic reasons: breast surgery (reduction or augmentation), benign skin lesions or lipomata, you should consider the extent to which the individual deviates from the normal range, and the impact of any anomaly on activities of daily living.

Unhappiness is a common experience among people wanting plastic surgery who do not receive NHS funding. This unhappiness is not, on its own, sufficient to make an individual exceptional.

Much of the varicose vein surgery undertaken in England is for cosmetic reasons, so you should also consider the impact on activities of daily living before referring.

For IVF- there is an age limit for starting treatment that is based on the probability of success. Please alert couples about the lead time to establish infertility (two years) and to undertake relevant investigation and medical treatment. Age and lack of understanding of the pathway are not exceptional reasons for access to IVF.

7. Is securing funding a guarantee of treatment?

Approval for NHS funding is NOT the same as a guarantee of treatment. Funding (the role of the commissioner for a whole population) is often requested before specialist assessment. However, the ultimate decision about safety and appropriateness of treatment is a clinical one, which must be discussed with the patient.

8. What happens when funding is approved?

It is the applicant i.e the patient's clinical representative’s responsibility to refer the patient for treatment. It is expected that this will take place within a maximum period of 12 months. If a referral is not completed within this time, a new application for funding would need to be submitted.

9. What if funding is declined?

If there are individual circumstances to be considered, and the decision is to decline funding, you will be sent details of how to appeal.

10. Who tells the patient if funding is declined?

We will tell the referring clinician, who remains responsible for ongoing treatment and care. The correspondence lays out this responsibility, and any timescales for action.

11. What about treatments that have already started under private arrangements?

If treatments have already been started under private arrangements, the assumption is that a whole package of care has been purchased and its potential complications taken account of. Therefore, it would be unreasonable to expect the NHS to pick up the costs associated with private treatment unless there is a medical emergency, or some other exceptional circumstance. Running out of funds, whilst unfortunate, is not exceptional.
12. What about treatments that have been started and completed under private arrangements?

Funding is not provided retrospectively. If treatment has been completed under private arrangements it is assumed that the patient has sufficient funds to cover this treatment.

13. What if I have a patient whose needs are exceptional?

Exceptionality is defined as:

‘The patient or their circumstances are significantly different from the general population of patients with the condition in question or the patient is likely to gain significantly more benefit from the intervention than might normally be expected for patients with that condition.’

We welcome Individual Funding Requests - either for patients who are clearly different from the group of patients covered by the policy - or for those with very unusual conditions or clinical presentations. Please:

- check the policies (see list below),
- use the web based application system to indicate how your patient is exceptional.

14. What about psychological considerations?

Some CCGs have taken account of psychological factors in arriving at a decision about eligibility for NHS funding, but this is hard to do in a clear and fair way. These considerations have been removed from the current draft of these policies.

NICE guidance indicates that clinicians should consider the possibility of Body Dysmorphic Syndrome when making referral for plastic surgery (NICE Clinical Guideline 31).

15. Are photographs helpful?

Photographs are not used in consideration of exceptionality - and handling them presents significant risks of compromising confidentiality. Please do NOT submit photographs. Any photographs received will be returned to sender upon receipt.

16. What if GPs make referrals outside the criteria outlined in these policies?

The implication is that there is no guarantee of payment, although the level of detail in these policies is not fully reflected in financial agreements with hospital providers.

17. What if surgeons undertake procedures outside the indications in these policies?

The implication is that there is no guarantee of payment, although legally binding contracts govern financial transactions.

18. Where can I find out more?
The National Prescribing Centre provide further guidance on this topic: http://www.npc.co.uk/faqs_ldm.php
Value Based Clinical Commissioning Policies

Cosmetic Surgery

Surgery for primarily cosmetic reasons is not eligible for NHS funding. A significant degree of exceptionality must be demonstrated before funding can be considered outside of these policies. Specifically, psychological factors are not routinely taken into consideration in determining NHS funding.

Whilst some degree of distress is usual among people who consider aspects of their physical appearance as undesirable, the degree of this will not routinely be taken into account in any funding decision. Further, it is expected clinicians consider the possibility of psychological problems including Body Dysmorphic Syndrome (NICE Clinical Guideline 31), assess for these and ensure appropriate management before considering any referral for plastic surgery.

This guidance applies to many of the following policies, in particular:

- Breast augmentation (Breast enlargement)
- Breast prosthesis removal or replacement
- Breast reduction
- Gynaecomastia
- Inverted nipple correction
- Mastopexy
- Revision mammoplasty
- Blepharoplasty
- Pinnaplasty
- Repair of lobe of external ear
- Rhinoplasty
- Orthodontic treatments
- Varicose veins
- Circumcision
- Vaginoplasty, Labial Vulvoplasty and Vulvar lipoplasty
- Hirsutism
- Removal of tattoos
- Resurfacing procedures
- Abdominoplasty or Apronectomy
- Face lift or brow lift
- Liposuction
- Removal of benign skin lesions
- Removal of lipomata
- Thigh lift, buttock lift and arm lift
- Hair grafting - Male pattern baldness

Abdominoplasty or Apronectomy

**Background:** abdominoplasty (also known as tummy tuck) is a surgical procedure performed to remove excess fat and skin from the mid and lower abdomen. Many people develop loose abdominal skin after pregnancy or substantial weight loss. However, surgery is not part of the usual response to these normal, physiological processes.

**Policy:** Abdominoplasty or Apronectomy will not be routinely funded

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Autologous Serum Eye Drops

**Background:** Autologous serum eye drops treat severe keratoconjunctivitis sicca (dry eye). Dry eyes can be helped with intensive treatment with artificial teardrops; however for some patients the symptoms are not completely relieved. The National Blood Service has developed an alternative to these artificial drops. Autologous serum eye drops are a last resort measure where all other conservative interventions have failed.
Policy: Autologous serum eye drops will only be funded in accordance with the criteria specified below.

- Patients have been treated with maximal tolerated artificial tear therapy (preservative free).
- Indefinite NHS funding will be subject to the submission of a progress report following a 5 month trial.

**Blepharoplasty**

**Background:** blepharoplasty is a surgical procedure performed to correct puffy bags below the eyes and droopy upper eyelids. It can improve appearance and widen the field of peripheral vision. It is usually done for cosmetic reasons. Consideration should be given to whether blepharoplasty or brow lift is the more appropriate procedure, particularly in the case of obscured visual fields.

Policy: Blepharoplasty will only be funded in accordance with the criteria specified below.

- Impairment of visual fields in the relaxed, non-compensated state;
  
  OR

- Clinical observation of poor eyelid function leading to discomfort, e.g. headache worsening towards end of day and/or evidence of chronic compensation through elevation of the brow.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p 8.

**Breast - Asymmetry**

Policy: Surgical correction of breast asymmetry will not be routinely funded.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p 8.

**Breast - Augmentation (Breast enlargement)**

This policy does not apply to breast reconstruction following mastectomy for treating breast cancer.

Policy: Breast augmentation will not be routinely funded.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p8.

**Breast – Inverted nipple correction**

**Background:** the term inverted nipple refers to a nipple that is tucked into the breast instead of sticking out or being flat. It can be unilateral or bilateral. It may cause functional and psychological disturbance. Nipple inversion may occur as a result of an underlying breast malignancy and it is essential that this be excluded.

Policy: Surgery for the correction of inverted nipple for cosmetic reasons will not be funded.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p 8.
Breast - Mastopexy

**Background:** breasts begin to sag and droop with age as a natural process. Pregnancy, lactation and substantial weight loss may escalate this process. This is sometimes complicated by the presence of a prosthesis which becomes separated from the main breast tissue leading to “double bubble” appearance.

**Policy: Mastopexy will not be routinely funded.**

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Breast - Prosthesis removal and/or replacement

**Background:** breast prosthesis may have to be removed after some complications such as leakage of silicone gel or physical intolerance. It may have to be replaced after the ‘life span’ of the implant is over.

**Policy: Breast prosthesis removal will only be routinely funded to make safe following silicon leakage. Breast prosthesis replacement will not be routinely funded.**

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Breast - Reduction

**Background:** excessively large breasts can cause physical and psychological problems. Breast reduction procedures involve removing excess breast tissue to reduce size and improve shape.

As excess weight is likely to exacerbate symptoms associated with large breasts, it is assumed that patients going forward for surgery will be near normal weight.

Assessing eligibility for surgery is problematic not least because there are several recognised approaches to measuring bra size [http://www.wikihow.com/Measure-Your-Bra-Size](http://www.wikihow.com/Measure-Your-Bra-Size), some of which relate to historical manufacturing standards.

The following approach to calculating cup size is recommended for standardisation (extracted from Modern Sizing section of above reference): subtract band size (below the breast) from the bust size (at the widest point). The difference between the two numbers determines cup size:

- Less than 1 inch difference = AA
- 1 inch difference= A
- 2 inches = B
- 3 inches = C
- 4 inches = D
- 5 inches = DD
- 6 inches = DDD (E in UK sizing)
- 7 inches = DDDD/F (F in UK sizing)
- 8 inches = G/H (FF in UK sizing)
- 9 inches = I/J (G in UK sizing)
- 10 inches = J (GG in UK sizing)
Policy: Breast reduction will only be funded in accordance with the criteria specified below.

Surgery for primarily cosmetic reasons is not eligible for NHS funding—see p 8.

For women:
- With documented evidence of significant chronic or repeated neck ache or backache that has not responded to conservative management and in the opinion of the surgeon, breast reduction is likely to significantly reduce the level of pain
- OR documented evidence of intractable intertrigo that has not responded to conservative treatment;
- AND wearing a professionally fitted brassiere has not relieved the symptoms;
- AND has a preoperative body mass index (BMI) of less than 27.0 kg/m².

As a guide, at least 500gms of tissue will be removed from each breast. The table below indicates how this relates to band and bust measurement.

<table>
<thead>
<tr>
<th>Band size (inches)</th>
<th>Minimum cup size</th>
</tr>
</thead>
<tbody>
<tr>
<td>32 / 34</td>
<td>&gt;= E</td>
</tr>
<tr>
<td>36</td>
<td>&gt;= EE (approx 6.5 inches difference between breast and bust measurement)</td>
</tr>
<tr>
<td>38</td>
<td>&gt;= F</td>
</tr>
<tr>
<td>40/42*</td>
<td>&gt;F</td>
</tr>
</tbody>
</table>

*once women have reached this size, they are likely to have a significant weight problem which should be addressed prior to surgery.

Carpal Tunnel Syndrome

**Background:** Evidence from observational studies shows that symptoms resolve spontaneously in some people: good prognostic indicators are short duration of symptoms, a young age, and carpal tunnel syndrome due to pregnancy.

There is good evidence that surgical treatment relieves the symptoms of carpal tunnel syndrome (CTS) more effectively than splinting. However splinting is effective in about 50% of people in the short term.

Carpal tunnel surgery is a low priority procedure for patients with intermittent or mild to moderate symptoms. The exception to this are patients who have not responded to 3 months of conservative management, including:
- At least 8 weeks of night-time use of wrist splints and/or
- Corticosteroid injection in appropriate patients

**Referral guidance:** Consider referral for electromyography and nerve conduction studies if the diagnosis is uncertain.

**Policy:** Carpal tunnel surgery will be funded if the following criteria are met:
- Confirmation that the referrer and the patient have discussed the NHS shared decision-making tool on carpal tunnel syndrome
AND
- Symptoms persist or recur after conservative therapy with either local corticosteroid injections and/or nocturnal splinting

OR
- There is neurological deficit, for example sensory blunting, thenar muscle wasting or motor weakness

OR
- There are severe symptoms that significantly interfere with daily activities.

Cholecystectomy (for asymptomatic gall stones)

Background: Cholecystectomy is the surgical removal of the gall bladder. Prophylactic cholecystectomy is not indicated in most patients with asymptomatic gallstones (Code: K80.2). Possible exceptions include patients who are at increased risk for gallbladder carcinoma or gallstone complications, in which prophylactic cholecystectomy or incidental cholecystectomy at the time of another abdominal operation can be considered. Although patients with diabetes mellitus may have an increased risk of complications, the magnitude of the risk does not warrant prophylactic cholecystectomy.

Policy: Cholecystectomy (for asymptomatic gall stones) will only be funded in exceptional clinical circumstances through an Individual Funding Request.

Circumcision

Background: Circumcision is a surgical procedure that involves partial or complete removal of the foreskin of the penis. It is an effective procedure and confers benefit for a range of medical indications.

Policy: Circumcision will only be funded for specific medical reasons in accordance with the criteria specified below.

Medical reasons for funding circumcision include:

- Phimosis in children with spraying, ballooning and/or recurrent infection;
- Adult Phimosis;
- Recurrent balanitis;
- Balanitis xerotica obliterans;
- Paraphimosis;
- Suspected malignancy;
- Dermatological disorders unresponsive to treatment;
- Congenital urological abnormalities when skin is required for grafting;
- Interference with normal sexual activity in adult males.

Excimer laser for cases with poor refraction after corneal transplant or cataract surgery

Background: This is a last resort measure where all other conservative and surgical interventions have failed.

Policy: This procedure will only be funded if all other conservative and surgical interventions have failed.
Face lift or brow lift

**Background:** these surgical procedures are performed to lift the loose skin of the face and forehead to get a firm and smoother appearance of the face. These procedures will not be funded to treat the natural processes of ageing.

**Policy:** Face lift or brow lift will only be funded in accordance with the criteria specified below.

These procedures will be considered for treatment of:

- Congenital facial abnormalities;
- Facial palsy (congenital or acquired paralysis);
- As part of the treatment of specific conditions affecting the facial skin eg. Cutis laxa, pseudoxanthoma elasticum, neurofibromatosis;
- To correct the consequences of trauma;
- To correct deformity following surgery;
- In some cases of impaired visual fields, where it may be a more appropriate primary procedure than blepharoplasty.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p 8.

**Fertility preservation for cancer patients**

Best practice recommends that the consideration of the potential impact of the cancer treatment on fertility is one of the issues that should be discussed before that treatment is started. In some cases the individual's fertility will return after the cancer treatment is completed but in other cases fertility never returns, or is severely impaired.

Preservation of fertility involves some form of freezing, technically called cryopreservation. The methods used in this service involve the cryopreservation of semen, oocytes and embryos. The service does not cover the storage of ovarian or testicular tissue.

**Policy:** Fertility preservation will be funded through requests from adult and paediatric oncology teams in accordance with the criteria specified below:

**Men**
The service should be offered to men and adolescent boys who are preparing for medical treatment for cancer that is likely to make them infertile. Adolescent boys who may also be capable of producing mature sperm and therefore benefiting from semen storage should be known to those treating their cancer and specialist advice and counselling should be available.

**Women**
The service should be offered to women of reproductive age (including adolescent girls) who are preparing for medical treatment for cancer that is likely to make them infertile if:

- they are well enough to undergo ovarian stimulation and egg collection and
- this will not worsen their condition and
- enough time is available before the start of their cancer treatment.

Staff must be aware of and take account of the child protection law for anyone under the age of 18.
The service will store cryopreserved material for an initial period of 10 years. The service will offer men the option to continue the storage of cryopreserved sperm beyond the 10 years if they remain at risk of significant infertility

**Ganglia**

**Background:** Ganglia are benign fluid filled, firm and rubbery lumps attached to the adjacent underlying joint capsule, ligament, tendon or tendon sheath. They occur most commonly around the wrist, but also around fingers, ankles and the top of the foot. They are usually painless and completely harmless. Many resolve spontaneously especially in children (up to 80%). Reassurance should be the first therapeutic intervention. Aspiration alone can be successful but recurrence rates are up to 70%. Surgical excision is the most invasive therapy but recurrence rates up to 40% have been reported. Complications of surgical excision include scar sensitivity, joint stiffness and distal numbness.

**Referral guidance**
- Include reference to the degree of pain and restriction of normal activities caused by the ganglion.

**Policy:** Surgical treatment for ganglia will only be funded in accordance with the criteria specified below.
- The ganglia are symptomatic;
- OR
- There is functional impairment.

**Gynaecomastia**

**Background:** Gynaecomastia (ICD-10 Code: N62X) is benign enlargement of the male breast. Most cases are idiopathic. For others endocrinological disorders and certain drugs such as oestrogens, gonadotrophins, digoxin, spironolactone, cimetidine and proton pump inhibitors could be the primary cause. Obesity can also give the appearance of breast development as part of the wide distribution of excess adipose tissue. Early onset gynaecomastia is often tender but this usually resolves in 3 to 4 months.

Full assessment of men with gynaecomastia should be undertaken, including screening for endocrinological and drug related causes and necessary treatment is given prior to request for NHS funding. It is important to exclude inappropriate use of anabolic steroids or cannabis.

**Policy:** Surgery to correct gynaecomastia will not be routinely funded.

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p8

**Hair grafting - Male pattern baldness and hair transplantation**

**Background:** male pattern baldness is a common type of hair loss and for many men it is a normal process at whatever age it occurs. Almost all men have some baldness in their 60s. Hair grafting is mostly done for aesthetic reasons.

**Policy:** Hair grafting for male pattern baldness will not be funded. Hair transplantation will not normally be funded
Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Hirsutism

**Background:** Laser treatment is increasingly being used as a cosmetic intervention to remove body hair. Patients with excessive body hair are described as having hirsutism. Hair depilation (for the management of hypertrichosis) involves permanent removal/reduction of hair from face, neck, legs, armpits and other areas of body usually for cosmetic reasons. Hair depilation is most effectively achieved by laser treatment.

**Policy:** Hair depilation will only be funded in accordance with the criteria specified below.

*One course of treatment will be funded* for those patients:

- Who are undergoing treatment for pilonidal sinuses to reduce recurrence,
- OR
- For patients with excessive hair who have undergone reconstructive surgery leading to abnormally located hair-bearing skin.

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Hyperhidrosis treatment with Botulinum Toxin

**Background:** Hyperhidrosis (ICD-10 Code: R61) is a condition characterised by excessive sweating, and can be generalised or focal. Generalised hyperhidrosis involves the entire body, and is usually part of an underlying condition, most often an infectious, endocrine or neurological disorder. Focal hyperhidrosis is an idiopathic disorder of excessive sweating that mainly affects the axillae, the palms, the soles of the feet, armpits and the face of otherwise healthy people. The principal management strategies for hyperhidrosis are medical [http://cks.nice.org.uk/hyperhidrosis#!scenario](http://cks.nice.org.uk/hyperhidrosis#!scenario).

BTX-A is only licensed for the treatment of severe axillary hyperhidrosis and its cost effectiveness compared to other treatment options is yet to be established.

**Policy:** Botulinum Toxin will only be funded in the management of severe axillary hyperhidrosis in accordance with the criteria below:

- The search for an underlying cause has been exhausted
- Advice on lifestyle management has been followed (use an antiperspirant frequently, Avoid tight clothing and manmade fabrics, wear white or black clothing to minimize the signs of sweating, consider dress shields to absorb excess sweat)
- 20% aluminium chloride hexahydrate has failed or is contraindicated.
- Any underlying anxiety has been identified and managed
- In the opinion of an experienced dermatologist, other treatment options have been exhausted

Infertility Treatment

This policy describes the eligibility criteria for NHS funded infertility treatment including:
• In vitro fertilisation (IVF);
• Intracytoplasmic sperm injection (ICSI);

Background: The Clinical Guideline on *fertility assessment and treatment* was published by NICE in February 2013 (NICE CG156, 2013) and covers all clinical procedures/pathways relating to fertility assessment and treatment. This document provides a single infertility specific commissioning policy for the NHS with the aim to ensure consistency in the application of the guideline across the North East region.

Over 80% of couples in the general population will conceive within 1 year if:

- the woman is aged under 40 years and
- they do not use contraception and have regular sexual intercourse (every 2 – 3 days).

Of those who do not conceive in the first year, about half will do so in the second year (cumulative pregnancy rate over 90%). [NICE 2004, amended 2013]

The estimated prevalence of infertility is one in seven couples in the UK. A typical Clinical Commissioning Group can expect about 230 new consultant referrals (couples) per 250,000 head of population per year (NICE CG11, 2004).

All couples are eligible for consultation and advice from the specialist service.

Definition of infertility:

A woman of reproductive age who has not conceived after 1 year of unprotected vaginal sexual intercourse, in the absence of any known cause of infertility, should be offered further clinical assessment and investigation along with her partner. IVF will only be funded after at least 2 years of unexplained infertility.

Offer an earlier referral for specialist consultation to discuss the options for attempting conception, further assessment and appropriate treatment where:

- the woman is aged 36 years or over
- there is a known clinical cause of infertility or a history of predisposing factors for infertility.

Definition of a full cycle:

This term is used to define a full IVF treatment, which should include 1 episode of ovarian stimulation and the transfer of any resultant fresh and frozen embryo(s).

Policy: IVF treatment will be funded in accordance with the criteria specified below.

<table>

Additional background notes to accompany policy are available on request.

**Abbreviations**

- IVF - In vitro fertilisation (IVF)
- ICSI - Intracytoplasmic sperm injection
- NICE - National Institute for Health and Clinical Excellence
- BMI - Body Mass Index

**Liposuction**

**Background:** Liposuction (also known as liposculpture), is a surgical procedure performed to improve body shape by removing unwanted fat from areas of the body such as
abdomen, hips, thighs, calves, ankles, upper arms, chin, neck and back. Liposuction is sometimes done as an adjunct to other surgical procedures.

**Policy:** Liposuction simply to correct the distribution of fat will not be funded.

**Pinnaplasty**

**Background:** pinnaplasty is performed for the correction of prominent ears or bat ears. Prominent ears are a condition where one's ears stick out more than normal. This condition does not cause any physical problems but may lead to significant psychosocial dysfunction for children and adolescents and impact on the education of young children as a result of teasing and truancy.

However, correction is considered to be a primarily a cosmetic procedure. Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

This policy does not cover other congenital abnormalities of the external ear. These should be managed by plastic surgeons and do not need prior approval through the IFR process.

**Policy:** Pinnaplasty will not normally be funded.

**Removal of benign skin lesions including scars**

**Background:** benign skin lesions include a wide range of skin disorders such as sebaceous cyst, dermoid cyst, skin tags, hirsutism, milia, molluscum contagiosum, seborrhoeic keratosis (basal cell papillomata), spider naevus (telangiectasia), warts, sebaceous cysts, xanthelasma, dermatofibromas, benign pigmented moles, comedones and corn/callous. Disfiguring scars and keloid whether arising from prior injury or surgery are also included in the scope of this policy.

Mostly these are removed on purely cosmetic grounds. The risks of surgical scarring must be balanced against the appearance of the lesion.

**Policy:** Removal of benign skin lesions will only be funded in accordance with the criteria specified below:

- when the lesion is repeatedly infected;
- subjected to recurrent trauma.

This guidance covers benign skin lesions only.

Where the lump is rapidly growing or abnormally located, specialist assessment should be sought.

Surgery for primarily cosmetic reasons is not eligible for NHS funding - see p 8.

**Removal of lipomata**

**Background:** Lipomata are benign tumours commonly found on the trunk and shoulder. These are removed mostly on cosmetic grounds. Patients with multiple subcutaneous lipomata may need a biopsy to exclude neurofibromatosis.
Policy: Removal of lipomata will only be funded in accordance with the criteria specified below.

- the lipoma (-ta) is / are symptomatic;
  
  OR
  - there is functional impairment.
  
  OR
  - for diagnostic purposes to exclude the possibility of malignancy

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Removal of tattoos

Policy: Tattoo removal will only be funded in accordance with the criteria specified below.

- Where the tattoo is the result of trauma, inflicted against the patient’s will (“rape tattoo”);

  OR
  - The patient was not Gillick competent, and therefore not responsible for their actions, at the time of the tattooing.

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Repair of lobe of external ear

Background: the external ear lobe can split partially or completely as result of trauma or wearing ear rings. Correction of split earlobes is not always successful and the earlobe is a site where poor scar formation is a recognised risk.

Policy: Repair of lobe of external ear will only be funded in accordance with the criteria specified below.

- If the totally split ear lobe is a result of direct trauma and the treatment is required at the time of, or soon after the acute episode and before permanent healing has occurred.

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

Resurfacing procedures: Dermabrasion, chemical peels and laser treatment

Background: dermabrasion involves removing the top layer of the skin with an aim to make it look smoother and healthier. Scarring and permanent discolouration of skin are the rare complications.

Policy: Resurfacing procedures will not be routinely funded

Procedures requested for primarily cosmetic reasons are not eligible for NHS funding- see p 8.

Reversal of female sterilisation
**Background:** Reversal of sterilisation is a surgical procedure that involves the reconstruction of the fallopian tubes.

Sterilisation procedure is available on the NHS and couples seeking sterilisation should be fully advised and counselled (in accordance with RCOG guidelines) that the procedure is intended to be permanent.

**Policy:** Reversal of sterilisation will not be routinely funded.

---

**Reversal of male sterilisation**

**Background:** Reversal of male sterilisation is a surgical procedure that involves the reconstruction of the vas deferens.

Sterilisation procedure is available on the NHS and couples seeking sterilisation should be fully advised and counselled (in accordance with RCOG guidelines) that the procedure is intended to be permanent.

**Policy:** Reversal of sterilisation will not be routinely funded.

---

**Rhinoplasty**

**Background:** Rhinoplasty is a surgical procedure performed on the nose to change its size or shape or both. People usually ask for this procedure to improve self-image.

**Policy:** Rhinoplasty will only be funded in accordance with the criteria specified below.

- Problems caused by obstruction of the nasal airway;
- Objective nasal deformity caused by direct trauma and the treatment is required at the time of, or soon after the acute episode and before permanent healing has occurred.
- Correction of complex congenital conditions e.g. cleft lip and palate.

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

---

**Thigh lift, buttock lift and arm lift, excision of redundant skin or fat**

**Background:** These surgical procedures are performed to remove loose skin or excess fat to reshape body contours. As the patient groups seeking such procedures are similar to those seeking abdominoplasty (see above), the functional disturbance of skin excess in these sites tends to be less and so surgery is less likely to be indicated except for appearance, in which case it should not be available on the NHS.

**Policy:** These procedures will not be routinely funded

Surgery for primarily cosmetic reasons is not eligible for NHS funding- see p 8.

---

**Tonsillectomy**
**Background:** Tonsillectomy is one of the most common surgical procedures in the UK. There is good evidence for the effectiveness of tonsillectomy in children but only limited evidence in adults.

**Policy:** Tonsillectomy will only be funded in accordance with the criteria specified below.

Patients must meet the criteria for one of the four groups

1. For recurrent severe sore throat in adults and children in the following circumstances:
   - The sore throats are due to acute tonsillitis;
   **AND**
   - The episodes of sore throat are disabling and prevent normal functioning
   **AND**
   - Seven or more well documented, clinically significant, adequately treated episodes of sore throat in the previous year;
   **OR**
   - Five or more such episodes have occurred in each of the preceding two years
   **OR**
   - Three or more such episodes have occurred in each of the preceding three years.
   **OR**

2. For the management of infective complications of tonsillitis such as quinsy

**OR**

3. For specific conditions and syndromes which require a tonsillectomy as part of their clinical management including severe tonsillar bleeding, severe neck infection

**OR**

4. For sleep disordered breathing (apnoea) in children if primary and secondary care assessments confirm large tonsils

**AND**

Impact on development, behaviour and quality of life.

---

**Vaginoplasty, Labial Vulvoplasty and Vulvar lipoplasty**

Surgery for Vaginoplasty, Labial Vulvoplasty and Vulvar lipoplasty are all cosmetic procedures. This policy does not cover vaginal repair following delivery and is part of obstetric or gynaecological treatment.
Surgery for primarily cosmetic reasons is not eligible for NHS funding—see p 8

Policy: Vaginoplasty will not routinely be funded.

Varicose veins in the legs

Background

Varicose veins are dilated, often palpable subcutaneous veins with reversed blood flow. They are most commonly found in the legs. Estimates of the prevalence of varicose veins vary. Visible varicose veins in the lower limbs are estimated to affect at least a third of the population. Risk factors for developing varicose veins are unclear, although prevalence rises with age and they often develop during pregnancy.

In some people varicose veins are asymptomatic or cause only mild symptoms, but in others they cause pain, aching or itching and can have a significant effect on their quality of life. Varicose veins may become more severe over time and can lead to complications such as changes in skin pigmentation, bleeding or venous ulceration. It is not known which people will develop more severe disease but it is estimated that 3–6% of people who have varicose veins in their lifetime will develop venous ulcers.

Referral to a vascular service guidance

Refer people with bleeding varicose veins to a vascular service immediately.

Referral guidance: Refer people to a vascular service if they have any of the following:

- History of bleeding from a varicosity which are at risk of bleeding again
- Ulceration which is progressive and/or painful despite treatment
- Active or healed ulceration and/or progressive skin changes that may benefit from surgery
- Recurrent superficial thrombophlebitis
- Discomfort attributable to varicose veins having a severe impact on quality of life.

Assessment and treatment in a vascular service

Assessment

Use duplex ultrasound to confirm the diagnosis of varicose veins and the extent of truncal reflux, and to plan treatment for people with suspected primary or recurrent varicose veins.

Interventional treatment

For people with confirmed varicose veins and truncal reflux:

- Offer endothermal ablation and Endovenous laser treatment of the long saphenous vein
- If endothermal ablation is unsuitable, offer ultrasound-guided foam sclerotherapy

---

3A team of healthcare professionals who have the skills to undertake a full clinical and duplex ultrasound assessment and provide a full range of treatment.
• If ultrasound-guided foam sclerotherapy is unsuitable, offer surgery.

If incompetent varicose tributaries are to be treated, consider treating them at the same time.

Non-interventional treatment

Compression hosiery to treat varicose veins is not recommended unless interventional treatment is unsuitable for clinical reasons or patient choice.

Policy

Interventional treatments for varicose veins outlined above will only be funded in accordance with the criteria specified below.

• Persistent ulceration that is painful or progressive
  OR
• Recurrent superficial thrombophlebitis where there is significant pain and disability
  OR
• Progressive skin changes that suggest potential ulceration due to venous insufficiency
  OR
• Significant haemorrhage from a ruptured superficial varicosity
  OR
• Patients with significant pain attributable to chronic venous insufficiency which is having a significant impact on quality of life and interfering with activities of daily living.

Patients whose primary concern is cosmetic will not be funded for surgical treatment. Surgery for primarily cosmetic reasons is not eligible for NHS funding - see page 8.

### September 2013

**Varicose veins**

Policy reviewed in light NICE guideline (CG168) published in July 2013 and discussed with chair of the cardiovascular network. Recommended interventions include the newer treatments: endothermal (radiofrequency) ablation endovenous laser treatment of the long saphenous vein and ultrasound-guided foam sclerotherapy. The policy now refers to interventional rather than surgical treatment.
